

Physisorg

Physis is an environmental organisation whose main objective is to mitigate the impact of climate change on vulnerable communities.

The organisation works towards creating practical sustainable solutions for populations more at risk to the effects of climate change.

We focus on developing and building resilient and adaptation strategies to lessen climate migration and displacement vulnerability

We take actions on prevention, early warning, preparedness, emergency response and recovery of climate disasters.

In addition, physis works tirelessly to influence national policies by government bodies and other stakeholders to create robust environmental legislation which prioritizes the protection of ecosystems, raising awareness through education programs to empower at risk populations with knowledge, resources and assistance.

The organization also ensures that its work is culturally sensitive and takes into account the distinct characteristics and challenges of different regions and communities.
